

# CS 4102: Algorithms – Unit C

## Dynamic Programming

Co-instructors: Robbie Hott and Tom Horton  
Spring 2022

# CS4102 Algorithms

Spring 2022

## Warm Up

How many arithmetic operations are required to multiply a  $n \times m$  matrix with a  $m \times p$  matrix?

(don't overthink this)

# Warm Up

How many arithmetic operations are required to multiply a  $n \times m$  Matrix with a  $m \times p$  Matrix?  
(don't overthink this)

- $m$  multiplications and  $m - 1$  additions per element
- $n \cdot p$  elements to compute
- Total cost:  $O(m \cdot n \cdot p)$

# Today's Keywords

- Dynamic Programming
- Matrix Chaining

# CLRS Readings

- Chapter 15
  - Section 15.1, Log/Rod cutting, optimal substructure property
    - Note:  $r_i$  in book is called Cut() or C[] in our slides. We use their example.
  - Section 15.3, More on elements of DP, including optimal substructure property
  - Section 15.2, matrix-chain multiplication (later example)
  - Section 15.4, longest common subsequence (even later example)

# Announcements

- Updated Deadlines for Unit B
  - Exam rescheduled for March 29
  - Encouraged to submit early, Unit C assignments are coming soon

# Dynamic Programming

- Requires **Optimal Substructure**
  - Solution to larger problem contains the solutions to smaller ones
  - Or: If  $S$  is an optimal solution to a problem, then the components of  $S$  are optimal solutions to sub-problems
- Idea:
  1. Identify the recursive structure of the problem
    - What is the “last thing” done?
  2. Save the solution to each subproblem in memory
  3. Select a good order for solving subproblems
    - “Top Down”: Solve each recursively
    - “Bottom Up”: Iteratively solve smallest to largest

# Generic Top-Down Dynamic Programming Soln

```
mem = {}  
def myDPalgo(problem):  
    if mem[problem] not blank:  
        return mem[problem]  
    if baseCase(problem):  
        solution = solve(problem)  
        mem[problem] = solution  
        return solution  
    for subproblem of problem:  
        subsolutions.append(myDPalgo(subproblem))  
    solution = OptimalSubstructure(subsolutions)  
    mem[problem] = solution  
    return solution
```

# Log Cutting Recursive Structure

$P[i]$  = value of a cut of length  $i$

$Cut(n)$  = value of best way to cut a log of length  $n$

$$Cut(n) = \max \begin{cases} Cut(n-1) + P[1] \\ Cut(n-2) + P[2] \\ \dots \\ Cut(0) + P[n] \end{cases}$$

# Matrix Chaining

- Given a sequence of Matrices  $(M_1, \dots, M_n)$ , what is the most efficient way to multiply them?

# Order Matters!

$$c_1 = r_2$$
$$c_2 = r_3$$

- $(M_1 \times M_2) \times M_3$ 
  - uses  $(c_1 \cdot r_1 \cdot c_2) + c_2 \cdot r_1 \cdot c_3$  operations

# Order Matters!

$$c_1 = r_2$$

$$c_2 = r_3$$

- $M_1 \times (M_2 \times M_3)$ 
  - uses  $c_1 \cdot r_1 \cdot c_3 + (c_2 \cdot r_2 \cdot c_3)$  operations

# Order Matters!

$$c_1 = r_2$$

$$c_2 = r_3$$

- $(M_1 \times M_2) \times M_3$

- uses  $(c_1 \cdot r_1 \cdot c_2) + c_2 \cdot r_1 \cdot c_3$  operations

- $(10 \cdot 7 \cdot 20) + 20 \cdot 7 \cdot 8 = 2520$

- $M_1 \times (M_2 \times M_3)$

- uses  $c_1 \cdot r_1 \cdot c_3 + (c_2 \cdot r_2 \cdot c_3)$  operations

- $10 \cdot 7 \cdot 8 + (20 \cdot 10 \cdot 8) = 2160$

$$M_1 = 7 \times 10$$
$$M_2 = 10 \times 20$$
$$M_3 = 20 \times 8$$

$$c_1 = 10$$

$$c_2 = 20$$

$$c_3 = 8$$

$$r_1 = 7$$

$$r_2 = 10$$

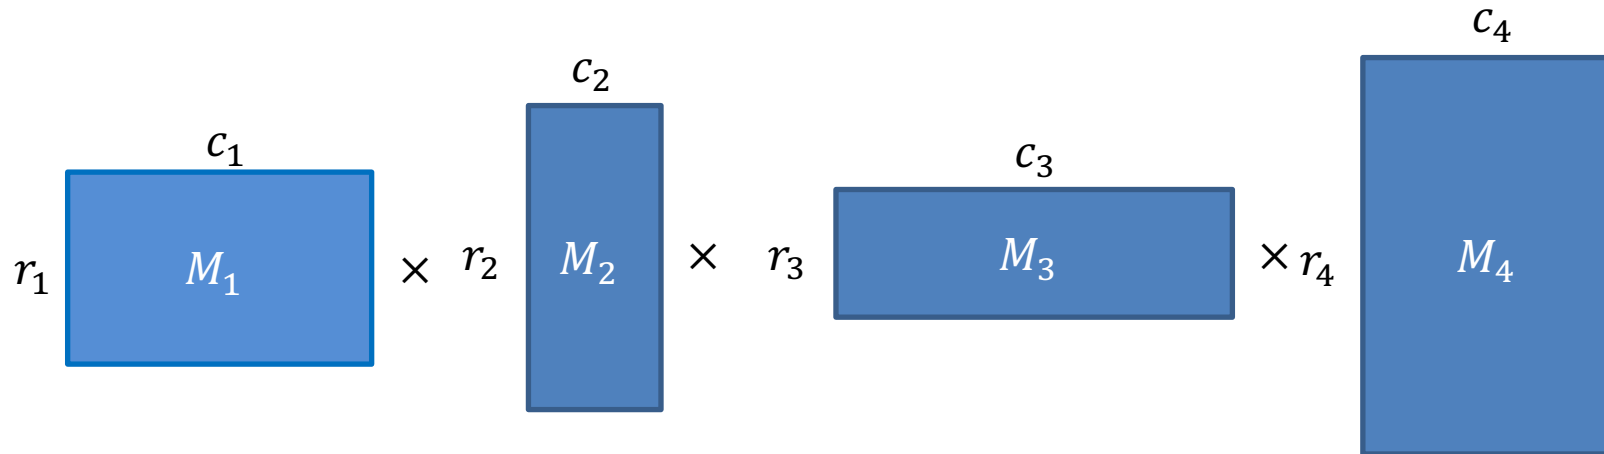

$$r_3 = 20$$

To find  $Best(i, j)$ : Need all preceding terms of row  $i$  and column  $j$

Conclusion: solve in order of diagonal

# Matrix Chaining

$$Best(i, j) = \min_{k=i}^{j-1} (Best(i, k) + Best(k+1, j) + r_i r_{k+1} c_j)$$

$$Best(i, i) = 0$$

	$j = 1$	$2$	$3$	$4$	$5$	$6$	$i$
	0	15750	7875	9375	11875	15125	1
		0	2625	4375	7125	10500	2
			0	750	2500	5375	3
				0	1000	3500	4
					0	5000	5
						0	6

$Best(1,6) = \min$ 

- $Best(1,1) + Best(2,6) + r_1 r_2 c_6$
- $Best(1,2) + Best(3,6) + r_1 r_3 c_6$
- $Best(1,3) + Best(4,6) + r_1 r_4 c_6$
- $Best(1,4) + Best(5,6) + r_1 r_5 c_6$
- $Best(1,5) + Best(6,6) + r_1 r_6 c_6$

# Run Time

1. Initialize  $Best[i, i]$  to be all 0s  $\Theta(n^2)$  cells in the Array
2. Starting at the main diagonal, working to the upper-right, fill in each cell using:

1.  $Best[i, i] = 0$

$\Theta(n)$  options for each cell

2.  $Best[i, j] = \min_{k=i}^{j-1} (Best(i, k) + Best(k + 1, j) + r_i r_{k+1} c_j)$

Each "call" to Best() is a  $O(1)$  memory lookup

$\Theta(n^3)$  overall run time

# Backtrack to find the best order

“remember” which choice of  $k$  was the minimum at each cell

$$Best(i, j) = \min_{k=i}^{j-1} (Best(i, k) + Best(k + 1, j) + r_i r_{k+1} c_j)$$

$$Best(i, i) = 0$$

$j =$	1	2	3	4	5	6	$= i$

$$Best(1, 2) + Best(3, 6) + r_1 r_3 c_6$$

$$Best(1, 3) + Best(4, 6) + r_1 r_4 c_6$$

$$Best(1, 4) + Best(5, 6) + r_1 r_5 c_6$$

$$Best(1, 5) + Best(6, 6) + r_1 r_6 c_6$$

# Storing and Recovering Optimal Solution

- Maintain table **Choice**[i,j] in addition to **Best** table
  - **Choice**[i,j] = k means the best “split” was right after  $M_k$
  - Work backwards from value for whole problem, **Choice**[1,n]
  - Note: **Choice**[i,i+1] = i because there are just 2 matrices
- From our example:
  - **Choice**[1,6] = 3. So  $[M_1 M_2 M_3] [M_4 M_5 M_6]$
  - We then need **Choice**[1,3] = 1. So  $[(M_1) (M_2 M_3)]$
  - Also need **Choice**[4,6] = 5. So  $[(M_4 M_5) M_6]$
  - Overall:  $[(M_1) (M_2 M_3)] [(M_4 M_5) M_6]$

# Dynamic Programming

- Requires **Optimal Substructure**
  - Solution to larger problem contains the solutions to smaller ones
  - Or: If  $S$  is an optimal solution to a problem, then the components of  $S$  are optimal solutions to sub-problems
- Idea:
  1. Identify the recursive structure of the problem
    - What is the “last thing” done?
  2. Save the solution to each subproblem in memory
  3. Select a good order for solving subproblems
    - “Top Down”: Solve each recursively
    - “Bottom Up”: Iteratively solve smallest to largest

# Longest Common Subsequence

Given two sequences  $X$  and  $Y$ ,  
find the length of their longest  
common subsequence

Example:

$X = ATCTGAT$

$Y = TGCATA$

$LCS = TCTA$

Brute force: Compare every  
subsequence of  $X$  with  $Y$   
 $\Omega(2^n)$

Applications other than bioinformatics?  
Of course, including version control!

# Top-Down Solution with Memoization

We need two functions; one will be recursive.

**LCS-Length(X, Y) // Y is M's cols.**

1.  $n = \text{length}(X)$
2.  $m = \text{length}(Y)$
3. Create table  $M[m,n]$
4. Assign -1 to all cells  $M[i,j]$
- // get value for entire sequences
5. return **LCS-recur**(X, Y, M, m, n)

**LCS-recur(X, Y, M, i, j)**

1. if  $(i == 0 \ || \ j == 0)$  return 0
- // have we already calculated this subproblem?
2. if  $(M[i,j] \neq -1)$  return  $M[i,j]$
3. if  $(X[i] == Y[j])$
4.  $M[i,j] = \text{LCS-recur}(X, Y, M, i-1, j-1) + 1$
5. else
6.  $M[i,j] = \max(\text{LCS-recur}(X, Y, M, i-1, j), \text{LCS-recur}(X, Y, M, i, j-1))$
7. return  $M[i,j]$

# Seinfeld

## Movie Time!

In Season 9 Episode 7 “The Slicer” of the hit 90s TV show *Seinfeld*, George discovers that, years prior, he had a heated argument with his new boss, Mr. Kruger. This argument ended in George throwing Mr. Kruger’s boombox into the ocean. How did George make this discovery?

# Seam Carving

- Method for image resizing that doesn't scale/crop the image

# Seam Carving

- Method for image resizing that doesn't scale/crop the image

# Seam Carving

- Method for image resizing that doesn't scale/crop the image

Cropped

Scaled

Carved

# Cropping

- Removes a “block” of pixels

Cropped

# Scaling

- Removes “stripes” of pixels

Scaled

# Seam Carving

- Removes “least energy seam” of pixels from bottom to top
  - <https://www.aryan.app/seam-carving/> (also see Wikipedia page)
  - <http://rsizr.com/> - old, uses Flash ☹️

Carved

# Seattle Skyline

# Energy of a Seam

- Sum of the energies of each pixel
  - $e(p)$  = energy of pixel  $p$
- Many choices
  - E.g.: change of gradient (how much the color of this pixel differs from its neighbors)
  - Particular choice doesn't matter, we use it as a “black box”

# Identify Recursive Structure

Let  $S(i, j)$  = least energy seam from the bottom of the image up to pixel  $p_{i,j}$

# Finding the Least Energy Seam

Want the least energy seam going from bottom to top, so delete:

$$\min_{k=1}^m (S(n, k))$$

# Computing $S(n, k)$

Assume we know the least energy seams for all of row  $n - 1$   
(i.e. we know  $S(n - 1, \ell)$  for all  $\ell$ )

# Computing $S(n, k)$

Assume we know the least energy seams for all of row  $n - 1$  (i.e. we know  $S(n - 1, \ell)$  for all  $\ell$ )

# Computing $S(n, k)$

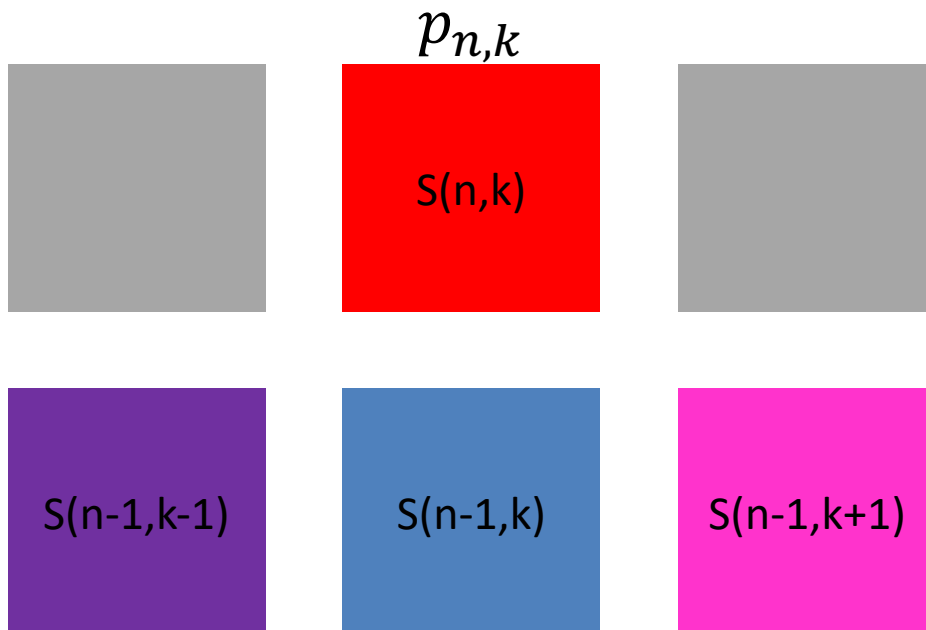

Assume we know the least energy seams for all of row  $n - 1$  (i.e. we know  $S(n - 1, \ell)$  for all  $\ell$ )

$$S(n, k) = \min$$

$$S(n - 1, k - 1) + e(p_{n,k})$$

$$S(n - 1, k) + e(p_{n,k})$$

$$S(n - 1, k + 1) + e(p_{n,k})$$

# Seam Carving

- Details left to you! Unit C Programming assignment
  - Note: Python or Java implementations only this time

# Repeated Seam Removal

Only need to update **pixels dependent** on the **removed seam**

$2n$  pixels change

$\Theta(2n)$  time to update pixels

$\Theta(n + m)$  time to find min+backtrack
