Binary Arithmetic, Bitwise Operations

CS 2130: Computer Systems and Organization 1
September 3, 2025

Announcements

- My Office Hours
  - TBD
- TA Office Hours starting soon
- Homework 1 available, due September 15, 2025

Finally, Numbers!

Storing Integers

- Use binary representation of decimal numbers
- Usually have a limited number of bits (ex: 32, 64)
  - Depending on language
  - Depending on hardware

Finally, Numbers!

Storing Integers

- Use binary representation of decimal numbers
- Usually have a limited number of bits (ex: 32, 64)
  - Depending on language
  - Depending on hardware
- Is there something missing?

Negative Integers

Representing negative integers

Negative Integers

Representing negative integers

- Can we use the minus sign?

Negative Integers

Representing negative integers

- Can we use the minus sign?
- In binary we only have 2 symbols, must do something else!
- Almost all hardware uses the following observation:

Representing Negative Integers

Computers store numbers in fixed number of wires

- Ex: consider 4-digit decimal numbers

Representing Negative Integers

Computers store numbers in fixed number of wires

- Ex: consider 4-digit decimal numbers
- Throw away the last borrow:
  - 0000 - 0001 = 9999 == -1
  - 9999 - 0001 = 9998 == -2
  - Normal subtraction/addition still works
  - Ex: -2 + 3

Representing Negative Integers

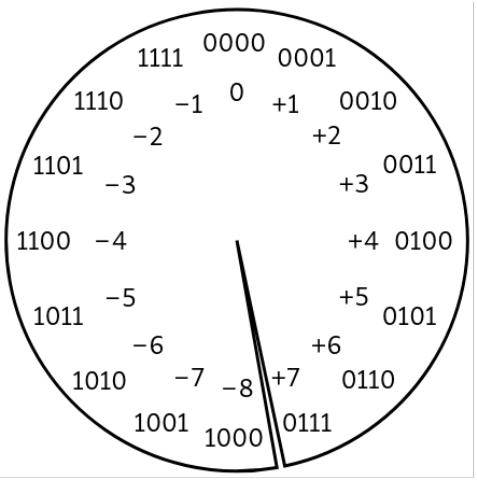
Computers store numbers in fixed number of wires

- Ex: consider 4-digit decimal numbers
- Throw away the last borrow:
  - 0000 - 0001 = 9999 == -1
  - 9999 - 0001 = 9998 == -2
  - Normal subtraction/addition still works
  - Ex: -2 + 3
- This works the same in binary

Two's Complement

This scheme is called **Two's Complement**

- More generically, a *signed* integer
- There is a break as far away from 0 as possible
- First bit acts vaguely like a minus sign
- Works as long as we do not pass number too large to represent



Two's Complement

Questions?

Values of Two's Complement Numbers

Consider the following 8-bit binary number in Two's Complement:

$$11010011$$

What is its value in decimal?

Values of Two's Complement Numbers

Consider the following 8-bit binary number in Two's Complement:

$$11010011$$

What is its value in decimal?

1. Flip all bits
2. Add 1

Operations

So far, we have discussed:

- Addition: $x + y$
  - Can get multiplication
- Subtraction: $x - y$
  - Can get division, but more difficult
- Unary minus (negative): $-x$
  - Flip the bits and add 1

Operations (on Integers)

Bit vector: fixed-length sequence of bits (ex: bits in an integer)

- Manipulated by bitwise operations

Bitwise operations: operate over the bits in a bit vector

- Bitwise not: `~x` - flips all bits (unary)
- Bitwise and: `x & y` - set bit to 1 if x, y have 1 in same bit
- Bitwise or: `x | y` - set bit to 1 if either x or y have 1
- Bitwise xor: `x ^ y` - set bit to 1 if x, y bit differs

Example: Bitwise AND

```
  11001010
& 01111100
----------
```

Example: Bitwise OR

```
  11001010
| 01111100
----------
```

Example: Bitwise XOR

```
  11001010
^ 01111100
----------
```

Your Turn!

What is: `0x1a ^ 0x72`

Operations (on Integers)

- Logical not: !x
  - $!0 = 1$ and $!x = 0, \forall x \neq 0$
  - Useful in C, no booleans
  - Some languages name this one differently

Operations (on Integers)

- Left shift: $x << y$ - move bits to the left
  - Effectively multiply by powers of 2
- Right shift: $x >> y$ - move bits to the right
  - Effectively divide by powers of 2
  - Signed (extend sign bit) vs unsigned (extend 0)
