

# **Floating Point Numbers**

CS 2130: Computer Systems and Organization 1

Xinyao Yi Ph.D.

**Assistant Professor** 

#### **Announcements**

- Homework 1 due September 15
- Lab 2 tomorrow!

### **Operations**

So far, we have discussed:

- Addition: x + y
  - Can get multiplication
- Subtraction: x y
  - Can get division, but more difficult
- Unary minus (negative): -x
  - Flip the bits and add 1

### **Operations (on Integers)**

Bit vector: fixed-length sequence of bits (ex: bits in an integer)

• Manipulated by bitwise operations

Bitwise operations: operate over the bits in a bit vector

- Bitwise not:  $\sim x$  flips all bits (unary)
- Bitwise and: x & y set bit to 1 if x, y have 1 in same bit
- Bitwise or:  $x \mid y$  set bit to 1 if either x or y have 1
- Bitwise xor:  $x \wedge y$  set bit to 1 if x, y bit differs

### **Operations (on Integers)**

Logical not: !x

- !0 = 1 and  $!x = 0, \forall x \neq 0$
- Useful in C, no booleans
- Some languages name this one differently

### **Operations (on Integers)**

Left shift:  $x \ll y$  - move bits to the left

• Effectively multiply by powers of 2

Right shift:  $x \gg y$  - move bits to the right

- Effectively divide by powers of 2
- Signed (extend sign bit) vs unsigned (extend 0)

• What about other kinds of numbers?

Floating point numbers

• Decimal: 3.14159

1\_\_\_\_decimal point.

Page 8

Floating point numbers

• Decimal: 3.14159

• Binary: 11.10110

1 binary point

### Floating point numbers

- Decimal: 3.14159
- Binary: 11.10110
- With integers, the point is always fixed after all digits
- With floating point numbers, the point can move!

Floating point numbers

• Decimal: 3.14159

• Binary: 11.10110

• With integers, the point is always fixed after all digits

• With floating point numbers, the point can move!

Challenge! only 2 symbols in binary

#### **Scientific Notation**

Convert the following decimal to scientific notation:

2130

2.130×103

#### **Scientific Notation**

Convert the following binary to scientific notation:

101101

1.01101×2<sup>5</sup>

### **Something to Notice**

An interesting phenomenon:

Decimal: first digit can be any number except 0/

$$2.13 \times 10^{3}$$

### **Something to Notice**

An interesting phenomenon:

- Decimal: first digit can be any number except 0  $2.13 \times 10^3$
- Binary: first digit can be any number except 0 Wait!  $(1)01101 \times 2^5$

### **Something to Notice**

An interesting phenomenon:

- Decimal: first digit can be any number except 0  $2.13 \times 10^3$
- Binary: first digit can be any number except 0 Wait!  $1.01101 \times 2^5$ 
  - First digit can only be 1

### **Floating Point in Binary**

We must store 3 components

- sign (1-bit): 1 if negative, 0 if positive
- fraction or mantissa: (?-bits); bits after binary point
- **exponent** (?-bits): how far to move binary point

depends on the hardware design.

We do not need to store the value before the binary point. Why?

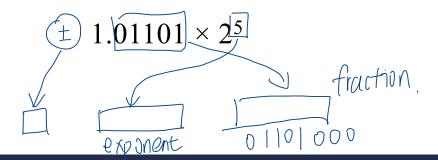

alway 1

### **Floating Point in Binary**

How do we store them?

- Originally many different systems
- IEEE standardized system (IEEE 754 and IEEE 854)
- Agreed-upon order, format, and number of bits for each

### Example

A rough example in Decimal:

$$6.42 \times 10^{3}$$

How do we store the exponent?

Exponents can be negative

$$2^{-3} = \frac{1}{2^3} = \frac{1}{8}$$

Need positive and negative ints (but no minus sign)

How do we store the exponent?

Exponents can be negative

$$2^{-3} = \frac{1}{2^3} = \frac{1}{8}$$

- Need positive and negative ints (but no minus sign)
- Don't we always use Two's Complement?

How do we store the exponent?

Exponents can be negative

$$2^{-3} = \frac{1}{2^3} = \frac{1}{8}$$

- Need positive and negative ints (but no minus sign)
- Don't we always use Two's Complement? Unfortunately Not

How do we store the exponent?

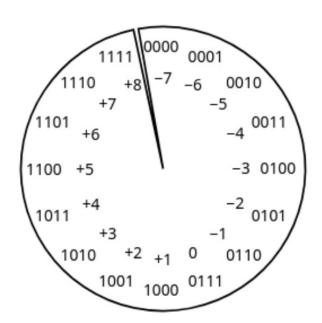

- Biased integers
  - Make comparison operations run more smoothly
  - Hardware more efficient to build
  - Other valid reasons

#### **Biased Integers**

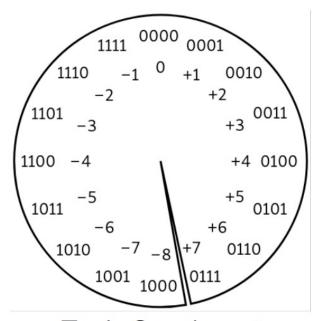

Similar to Two's Complement, but add bias

- Two's Complement: Define 0 as 00...0
- **Biased**: Define 0 as 0111...1
- Biased wraps from 000...0 to 111...1

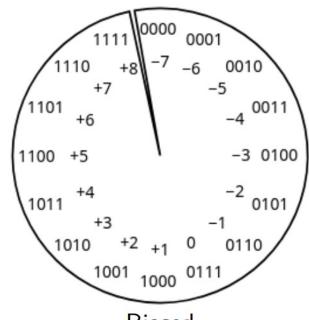

## **Biased Integers**

Two's Complement

#### **Biased Integers Example**

Calculate value of biased integers (4-bit example)

2's complement -> Biased Integers: add the bias.

Biased Integers -> 2's complement: substract the bias.

### **Floating Point Example**

```
1 bit: sign
4 bits: exponent
3 bits: fraction
