Floating Point Example

What does the following encode?

1 001110 1010101

What about 0?

Floating Point Numbers

Four cases:

- **Normalized:** What we have seen today

$$s \ eeee \ ffff = \pm 1.ffff \times 2^{eeee - \text{bias}}$$

- **Denormalized:** Exponent bits all 0

$$s \ eeee \ ffff = \pm 0.ffff \times 2^{1 - \text{bias}}$$

- **Infinity:** Exponent bits all 1, fraction bits all 0 (i.e., $\pm\infty$)
- **Not a Number (NaN):** Exponent bits all 1, fraction bits not all 0

More bits, circuits, adders

Warm up!

Can I make an n -input AND from 2-input AND gates?

What about XOR gates?

Operations

So far, we have discussed:

- Addition: $x + y$
 - Can get multiplication
- Subtraction: $x - y$
 - Can get division, but more difficult
- Unary minus (negative): $-x$
 - Flip the bits and add 1

Operations (on Integers)

Bit vector: fixed-length sequence of bits (ex: bits in an integer)

- Manipulated by bitwise operations

Bitwise operations: operate over the bits in a bit vector

- Bitwise not: $\sim x$ - flips all bits (unary)
- Bitwise and: $x \& y$ - set bit to 1 if x, y have 1 in same bit
- Bitwise or: $x | y$ - set bit to 1 if either x or y have 1
- Bitwise xor: $x \wedge y$ - set bit to 1 if x, y bit differs

Operations (on Integers)

Logical not: $!x$

- $!0 = 1$ and $!x = 0, \forall x \neq 0$
- Useful in C, no booleans
- Some languages name this one differently

Operations (on Integers)

Left shift: $x \ll y$ - move bits to the left

- Effectively multiply by powers of 2

Right shift: $x \gg y$ - move bits to the right

- Effectively divide by powers of 2
- Signed (extend sign bit) vs unsigned (extend 0)

Floating Point Numbers

Four cases:

- **Normalized:** What we have seen today

$$s \ eeee \ ffff = \pm 1.ffff \times 2^{eeee - \text{bias}}$$

- **Denormalized:** Exponent bits all 0

$$s \ eeee \ ffff = \pm 0.ffff \times 2^{1 - \text{bias}}$$

- **Infinity:** Exponent bits all 1, fraction bits all 0 (i.e., $\pm\infty$)
- **Not a Number (NaN):** Exponent bits all 1, fraction bits not all 0

Our Story So Far

- Transistors
- Information modeled by voltage through wires (1 vs 0)
- Gates: $\&$ $|$ \sim \wedge
- Multi-bit values: representing integers
 - Signed and unsigned
 - Bitwise operators on bit vectors
- Floating point

How to do the work of multi-bit?

Multi-bit Mux

Our first multi-bit example: mux

Adder
